

Delta Rapid Scalper

User Manual

PRECISION SCALPING SIGNALS FOR CRYPTO FUTURES

95% indicator · 5% trader

Delta Rapid Scalper does the heavy lifting: it reads the market and tells you exactly when to act with BUY, SELL and PEAK alerts. The remaining 5% is you — a little feel and discipline. Follow the rules to the letter: that is what gives the best results.

> This is a trading tool, not financial advice. Trading leveraged crypto carries real risk of loss. Never risk money you cannot afford to lose, and always use your stop loss.

How it works

Every coin uses three alerts you set once in TradingView. There are two coin types, each with its own rules:

- 🔵 Blue chips — the core method, simple and mechanical.
- 🟠 Volatile coins — advanced, needs chart reading and experience.

Recommended exposure

Trade at most 6 blue chips and 2 volatile coins open at the same time. More than that is hard to manage well.

6	2
🔵 blue chips max	🟠 volatile max

What you need (TradingView)

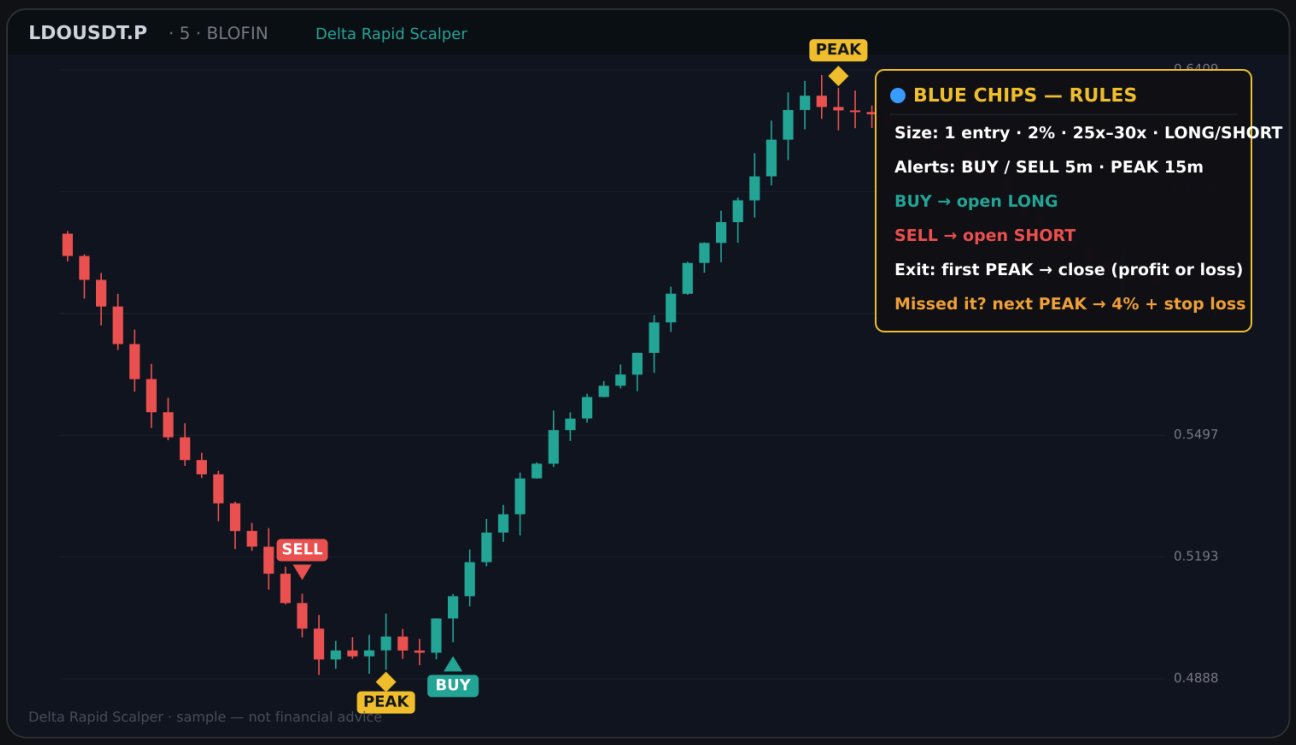
The indicator runs on alerts, so you need a TradingView plan with at least 100 alerts. Each blue chip uses 3 alerts (BUY, SELL, PEAK) and each volatile coin uses 2 (BUY, PEAK), so a full watchlist adds up fast.

> The **Plus** plan covers it (100 alerts): approx. **$34.95/month**, or **~$29.95/month billed yearly (~$359/year)**. Prices vary by country and can change — check tradingview.com/pricing.

🔵 Blue chips — how to trade

1. **Coins:** only coins on the blue chip list.
2. **Size:** one entry of 2% of your account, 25x–30x leverage, LONG or SHORT.
3. **Alerts:** BUY and SELL on the 5-minute chart, PEAK on the 15-minute chart.
4. **Entry:** BUY fires → open LONG. SELL fires → open SHORT.
5. **Exit:** close at the first PEAK, whether you are in profit or in loss.
6. **Missed it?:** if you missed that PEAK and the trade went against you, wait for the next PEAK, add a 4% martingale entry and set your stop loss just past that PEAK. The stop is mandatory.

How it looks on your chart



🟠 Volatile coins — how to trade

Advanced method. It relies on reading the chart and on experience. Master the blue chips first.

> Which coins: the 5 coins on each exchange with the biggest gain over the last 24 hours.

1. **Size:** up to 5 entries of 1% each, 10x maximum.
2. **Alerts:** BUY and PEAK, both on the 15-minute chart.
3. **First entry:** when PEAK fires, check the chart. If the candle left a long wick on top, open a SHORT with 1%.
4. **Scaling in (DCA):** if price keeps rising, add more 1% entries on the next PEAKs with a long wick, up to 5 in total.
5. **Stop loss:** this one is down to your read — watch for volume exhaustion and place the stop well above the last wick. If you are not sure, ask our team.
6. **Break even:** when price falls and the first PEAK fires, move the stop to break even — from there the trade can no longer lose.
7. **Take profit:** let the coin bleed out and close when the BUY alert fires.
8. **Flip to LONG:** if a BUY fires while you are waiting, close the SHORT and open a LONG with 2%, then manage it like a blue chip.

Any doubt or situation, ask our team — thanks to you, we keep getting better.

How it looks on your chart

Start small, build up

Begin with a single trade: open it, then close it. Once you are comfortable, move to two at a time, then three, and so on — up to the 8 we recommend open at once (6 blue chips + 2 volatile). Building up like this is the best way to learn the method and get the most out of it.

FAQ

What exactly do I get?
The Delta Rapid Scalper TradingView indicator (invite-only) with BUY, SELL and PEAK alerts, the full method for blue chips and volatile coins, the blue chip list, and real human support on Telegram.

Do I need experience?
No. Blue chips are mechanical: you just follow BUY, SELL and PEAK. Volatile coins are the advanced part — leave them until you have the blue chips down.

What is your setup?
It is signal-based, not a fixed TP1–TP4 grid. Blue chips: one 2% entry at 25–30x, enter on BUY/SELL, close on the first PEAK. Volatile coins: up to 5 entries of 1% (DCA) at 10x.

Where is the stop?
Structure-based, and always mandatory. On blue chips it comes in only on the martingale (just past the PEAK). On volatile coins, above the last wick.

Is it automatic?
It can be. Route the alerts into Cornix for auto-trading, or trade them by hand from your phone. A Cornix channel is coming soon.

Do you guarantee profit?
No — no one honest can. This is a tool and a method; trading leveraged crypto carries real risk. Follow the rules and manage your risk your way.

Blue chip list

These are the coins our team currently treats as blue chips. The list keeps growing as we test and approve new coins for the team.

ANKR TOMO DASH SUSHI SKL UNFI FTM SFP

Trader's tips

- ✔ When your slots are full (6 blue chips + 2 volatile, 8 trades in total), turn off the alerts on every other coin. That way you can focus on the trades you already have open and keep a clear head — you only get alerted on what you can actually trade, and you avoid overtrading.
- ✔ Once a trade has its stop at break even it can no longer lose, so that slot is free again — you can open another trade in its place.
- ✔ Start with just a few positions and build up gradually, as you get a natural feel for the method. Do not jump to the full 6 + 2 on day one.
- ✔ When a slot frees up, switch all your alerts back on to hunt for a new trade. Once you are in, pause the rest again so they do not distract you.
- ✔ You are free — encouraged, even — to adapt how you protect your trades to your own style: take partial profits, move your break even earlier, and so on. The rules are the backbone, not a cage.

Final note

The edge is in the discipline. The indicator gives you the signals; your job is to follow them and manage risk your way. We just give you the tool you need to become a successful trader — the rest is in your hands.
